OMICRON TEMPERATURE & PRESSURE CALIBRATORS

Portable calibrators for testing temperature sensors, pressure sensors, indicators, switches and safety equipment.

In the temperature calibrators the heating medium is hot air, which makes it clean to use with quick temperature change response. Temperature range is about 10 degrees above ambient to +700 degrees Celsius with digital readout of the measured temperature.

In pressure calibrators the pressure medium is oil. It has fine adjustment of the pressure and an overpressure relief valve. The digital readout can be selected to bar or PSI. Pressure range is 0-200 bar. 0-1999 PSI.

Omicron calibration equipment is Type approved by Det Norske Veritas.
